Research needs from practice REPORT

FEBRUARY 2021

Why collect research needs from practice?

Many research results are translated into practical applications very slowly, or not at all. On the other hand, professionals such as farmers and foresters may have the impression that research does not meet their needs. Defining “research needs from practice” can help solve this, by facilitating dialogue between researchers and those that can use research results in practice.

This report defines “research needs from practice” as problems which professionals from the farming and forestry sectors come across in their daily work, and for which research may provide solutions. These may include:

- ▶ New ways of working, which have been tested in practice and would benefit from further research.
- ▶ Inventions or innovative solutions discovered by farmers or foresters, which could be improved or adapted with further research.

The EIP-AGRI Service Point collects research needs from practice during workshops, seminars, Focus Group meetings and other networking activities, through activity reports of agricultural or forestry organisations and also via a dedicated [online form](#) on the EIP-AGRI website.

By making these research needs visible via the EIP-AGRI website, others with an interest in the same issue can review them and provide an answer to the problem. They can also decide to take up the question and try to solve it, for instance by setting up an innovative project with other partners.

These research needs will also become visible for national and regional policy makers and authorities, who may decide to take up specific topics in their calls for innovative projects. Of course this information is also feeding into the programming of European Research and Innovation activities.

Scope of this summary report

This report takes into account the outcomes of a number of EIP-AGRI Focus Groups, workshops and seminars. These were completed by information submitted via the EIP-AGRI online form. It covers the period between 15 November 2019 – 14 November 2020 and comprises the following agricultural topics:

- ▶ FG 30 on “Frost damage” ([final report](#))
- ▶ FG 33 on “Pest and diseases of the olive tree” ([final report](#))
- ▶ FG 37 on “Contaminated Soil” ([final report](#))
- ▶ FG 36 on “Soil salinisation” ([final report](#))
- ▶ FG 35 on “Plant-based medicinal and cosmetic products” ([final report](#))
- ▶ FG 29 on “New feed for pigs and poultry” ([final report](#))
- ▶ FG 32 on “Non-chemical weed management” ([final report](#))
- ▶ FG 34 on “Bee health” ([final report](#))
- ▶ FG 31 on “Reducing food loss on the farm” ([final report](#))

Analysis of common themes

This report shows the **diversity of needs** for research from practice, but it also shows **similarities and connections** between the different agricultural sectors. Several issues appear to be important for different sectors and have been discussed in different Focus Groups:

RECURRING THEMES AND NEEDS	DISCUSSED BY
<p>Different climate conditions / climate change</p> <p>Behaviour and phenology of cultivars under different climate conditions;</p> <p>Effect of climate change on olive pests and pathogens; Cover crops: knowledge gaps concerning selection of species compositions for different agro-climatic areas;</p> <p>Local plant species for different climatic conditions and specific for each soil remediation method;</p> <p>Improving the profiling of nutritional content of crops grown under saline conditions – for two reasons: to define commercial return for quality improvements and to allow information sharing on accumulation of sodium in food products (NB with climate change it is anticipated that agricultural systems may change to include more crops grown under saline conditions);</p> <p>Salinisation risk in critical areas considering different climate change scenarios;</p> <p>Climate change adaptation of medicinal plant species (effects of climate change on medicinal flora in terms of their life cycle, secondary metabolites and the distribution of specific plant species).</p>	<ul style="list-style-type: none"> • FG 30 on “Frost damage”, • FG 33 on “Pest and diseases of the olive tree”, • FG 37 on “Contaminated Soil”, • FG 36 on “Soil salinisation”, • FG 35 on “Plant-based medicinal and cosmetic products”
<p>Plant/animal breeding</p> <p>Breeding schemes of Black Soldier Flies;</p> <p>Potential of evolutionary breeding (composite cross-populations¹) to breed for competitiveness; Breeding for short season crop varieties; Breeding for allelopathic crop varieties; Breeding for weed-suppressive and tolerant varieties/crops: Screening programme for crop variety suppressiveness;</p> <p>Introducing tolerance traits in high yielding lines; Physiological and molecular basis of crop tolerance to salinity;</p> <p>Molecular markers as a tool for exploring genetic diversity for crop improvement; Effects of commercial captive breeding and artificial propagation on wild species conservation;</p>	<ul style="list-style-type: none"> • FG 29 on “New feed for pigs and poultry”, • FG 32 on “Non-chemical weed management”, • FG 36 on “Soil salinisation”, • FG 35 on “Plant-based medicinal and cosmetic products”,

¹ A composite cross population (CCP) is created by crossing a number of plants from different lines, and subsequently bulking seeds from the resulting offspring. This makes a CCP a population of plants with a lot of inherent genetic diversity, in contrast to monocultures. (from Wikipedia)

<p>Breeding efforts in all countries in order to maintain the local populations of honeybees, as well as to identify resistant populations to Varroa. Breeding local honeybees and honeybees that are well adapted to their climatic conditions and will improve resilience.</p>	<ul style="list-style-type: none"> • FG 34 on "Bee health"
<p>Data standardisation / data access & exchange</p> <p>Database on potential yields for different species/varieties and critical temperatures on species/variety level;</p> <p>Standardisation of analytical methods - European guidelines on harmonised methods for measuring, mapping and monitoring soil salinity;</p> <p>Database on production of MAP (Medicinal and aromatic plant) species; Database on the moisture sorption isotherms of important MAP species;</p> <p>European platform better connecting research and practice and contributing to efficiently gathering and exchanging knowledge (on beekeeping and bee health).</p>	<ul style="list-style-type: none"> • FG 30 on "Frost damage", • FG 36 on "Soil salinisation", • FG 35 on "Plant-based medicinal and cosmetic products", • FG 34 on "Bee health"
<p>Decision support tools</p> <p>App for assessing frost protection measures considering risk (simulation tool);</p> <p>Digital agriculture - full agri-food chain monitoring and control;</p> <p>Multi-actor and interdisciplinary decision support tools that are easy-to-use and help farmers and decision makers to implement sustainable soil management technologies;</p> <p>Decision support systems to support decision making - develop a practical tool for growers or cooperatives growing plants for medicinal and cosmetic products (decisions related to on-farm production and processing operations based on multi-source data integration).</p>	<ul style="list-style-type: none"> • FG 30 on "Frost damage", • FG 31 on "Reducing food loss on the farm", • FG 37 on "Contaminated Soil", • FG 35 on "Plant-based medicinal and cosmetic products"
<p>Digital-based solutions / sensors / precision farming</p> <p>Intelligent intra-row weeding technologies to operate in direct-sown row crops; Individual plant recognition for more precision in weeding; For single plant weed control, detection and control must be performed in a one-stage setup. Improving camera and detection systems is an important research need;</p> <p>New systems for pests and diseases monitoring: Specifically making use of new technologies (IT tools and Internet of Things technologies);</p>	<ul style="list-style-type: none"> • FG 32 on "Non-chemical weed management", • FG 33 on "Pest and diseases of the olive tree",

<p>Soil (contamination) monitoring on farm level - Development of smart sensors and/or affordable tools for fast determination methods; Alternative systems for soil scanning and monitoring (of contamination) using state of the art technologies such as remote sensing and drones; Precision agriculture - technology for precise use of chemical inputs at the right spot and the right time to minimise the impact on the environment and soil quality; Precision agriculture technology affordable and usable also for small scale farmers;</p> <p>Smart flushing – “leaching” /specific tools based on models, sensors, weather forecasts, climate and soil data in models (to reduce soil salinisation); Methodologies (sensors, remote sensing, GIS...) to identify sustainable and non-profit agriculture areas that should go through a land-use change; Cheap but reliable sensors for salinity measurement; Use and integration of satellite data: satellite images of higher spatial and spectral resolution to map soil salinity at farm level;</p> <p>Sensors and digital tools to support decision making - develop a practical tool for growers or cooperatives growing plants for medicinal and cosmetic products (decisions related to on-farm production and processing operations based on multi-source data integration.</p>	<ul style="list-style-type: none"> • FG 37 on “Contaminated Soil”, • FG 36 on “Soil salinisation”, • FG 35 on “Plant-based medicinal and cosmetic products”
<p>Farmers’ motivation</p> <p>Increase farmers’ awareness on the importance of honeybees and pollinators;</p> <p>Farmers’ risk perception and subsequent decision making on weed management needs to be integrated in the process of developing weed control strategies that work on the farm, in terms of economics, timing, labour availability.</p>	<ul style="list-style-type: none"> • FG 34 on “Bee health”, • FG 32 on “Non-chemical weed management”
<p>Long term research</p> <p>Weed biology: long-term experiments with integration of preventive and direct methods;</p> <p>Long-term experiments for validation of the (biological) remediation techniques for contaminated soil;</p> <p>Long-Term Experiments (LTEs) to obtain the crop and soil data needed for model parameters for simulation tools, so these tools can become operational innovations in agriculture.</p>	<ul style="list-style-type: none"> • FG 32 on “Non-chemical weed management”, • FG 37 on “Contaminated Soil”, • FG 36 on “Soil salinisation”
<p>Soil contamination</p> <p>Sources of contamination of agricultural soil: long-term build-up of persistent organic contaminants in agricultural soils, accumulation, bioavailability, effects on soil biota, interactions with soil constituents, potential leaching and runoff; Sources of contamination of agricultural soil: pesticides: environmental risk assessment of their interaction, and the establishment of</p>	<ul style="list-style-type: none"> • FG 37 on “Contaminated Soil”,

<p>threshold values in soils for approved currently used pesticides; Sources of contamination of agricultural soil: biochar and compost: potential absorption and adsorption of contaminants, specific mechanisms in soils amended with biochar and compost on the (im)mobilisation of organic and inorganic contaminants, on the modification of their (eco)toxic effects, on the translocation of these contaminants from roots to shoots, and on the migration towards groundwater; Biological remediation - strategies for new pollutants: microplastics, fluorinated compounds, endocrine disruptors, drug residues; Biological remediation - strategies for mixed combined contamination: organic and inorganic pollutants, or heavy metals and metalloids; Biological remediation - criteria for remediated soils: pollutant bioavailability, risk assessment, soil health and biodiversity;</p> <p>Data on the Pyrrolizidine Alkaloids identified, understand the mechanism of contamination, sources of exposure, level of toxicity and updated risk management.</p>	<ul style="list-style-type: none"> • FG 35 on "Plant-based medicinal and cosmetic products"
<p>Food/non-food value chains</p> <p>Multi-actor 'value chain approach' to research on food loss and waste on the farm with an integrated mix of researchers, businesses (large and SME) and the citizen (consumer);</p> <p>Value chain analysis in terms of a life cycle assessment; Improved quality assurance along the value chain.</p>	<ul style="list-style-type: none"> • FG 31 on "Reducing food loss on the farm", • FG 35 on "Plant-based medicinal and cosmetic products"

The following overview clusters the identified research needs according to the priorities and cross-cutting issues that have been identified by the EC [strategy for agricultural research and innovation](#).

Priorities and cross cutting issues	Research needs identified
<p>Resource management</p> <p>See</p> <ul style="list-style-type: none"> • FG 36 on "Soil salinisation" 	<p>Water harvesting - Natural water resources, such as rainfall, should be better managed; Smart flushing – "leaching" guidelines for soils prone to salinisation; Adaptive drainage; Mixing irrigation water, including closing water cycles; New irrigation systems for field crops, major crops, extensive crops, such as micro-irrigation for field crops;</p>
<p>Healthier plants and animals</p> <p>See</p> <ul style="list-style-type: none"> • FG 36 on "Soil salinisation", 	<p>Studies on microbiota functions under different naturally-salt affected soil as model system --> microbiome or belowground biodiversity can contribute to improve plants' resistance to salinity; Select the most (salinity) tolerant commercial varieties and start from those to improve them; Physiological and molecular basis of crop tolerance to salinity;</p>

<ul style="list-style-type: none"> • FG 34 on "Bee health", • FG 30 on "Frost damage", • FG 29 on "New feed for pigs and poultry", • FG 32 on "Non-chemical weed management", • FG 33 on "Pest and diseases of the olive tree" 	<p>Index to synthesise the health status of individual honeybees and their colonies; Bees: effects of exposure to stressors from agriculture, including e.g.: knowledge of the effect of novel chemicals, including their sublethal effects and interactions with other chemicals or stressors such as flowering resource quality and quantity; Breeding efforts in all countries in order to maintain the local populations of honeybees, as well as to identify resistant populations to Varroa. (Breeding local honeybees and honeybees that are well adapted to their climatic conditions will improve resilience.);</p> <p>Effectiveness of different chemicals used for frost protection (enhancing frost resistance, delaying budbreak or bloom) under different field conditions; Frost protection: reliable monitoring and alarm system that relies both on surface and profile information of temperature, humidity and wind speed; Frost protection: below-ground sprinkling (in combination with hot air machines) for stone fruit;</p> <p>Nutrient requirements of black soldier fly (BSF); Limits of inclusion levels of novel feedstuff - palatability, health, body composition (e.g. of BSF larvae); Right level and way to include green protein (grass/clover) in feed? Effect on performance, microbiota, health, animal welfare; New feeds for pigs and poultry: balanced diets with amino acids and novel feedstuff;</p> <p>Breeding for weed-suppressive and tolerant varieties/crops - screening programme for crop variety suppressiveness; Breeding for weed-suppressive and tolerant varieties/crops - breed for competitiveness; Breeding for allelopathic varieties - traits and the combination of traits for weed suppression and tolerance to weeds, both by individual crops and crop mixtures;</p> <p>Effect of Climate Change on olive pests and pathogens; New systems for pests and diseases monitoring: specifically making use of new technologies (IT tools and Internet of Things technologies); New biotechnological phytosanitary tools (semiochemicals, attractants, deterrents, repellents, etc.) to control olive pests; Understanding on how enhancement of the functional biodiversity can affect potential natural enemies of the key pest of the olive tree.</p>
<p>Integrated ecological approaches from farm to landscape levels</p> <p>See</p> <ul style="list-style-type: none"> • FG 33 on "Pest and diseases of the olive tree", • FG 36 on "Soil salinisation" 	<p>Cost/feasibility of cover crop establishment/improvement and the associated benefits (ecosystem services);</p> <p>Assess soil salinisation impact off-site, environmental impact and ecosystem services.</p>

<p>New openings for rural growth</p> <p>See</p> <ul style="list-style-type: none"> • FG 35 on "Plant-based medicinal and cosmetic products" 	<p>Potential of non-wood forest products (e.g. forest fruits, mushrooms, cork, pine nuts medicinal plants, essential oils etc.) in rural development; Farmer-led and low-cost green biorefineries in the MAP (Medicinal and aromatic plant) sector.</p>
<p>Enhancing the human and social capital in rural areas</p> <p>See</p> <ul style="list-style-type: none"> • FG 35 on "Plant-based medicinal and cosmetic products" • FG 37 on "Contaminated Soil", 	<p>Farm demonstrations of state-of-the-art and emerging drying technologies;</p> <p>Sustainable farm management - farm-centered approach to incorporate wider biophysical, socio-economic and business components into the farming system.</p>
<p>Information and Communication Technologies (ICT) as an enabler</p> <p>See</p> <ul style="list-style-type: none"> • FG 30 on "Frost damage", • FG 29 on "New feed for pigs and poultry", • FG 32 on "Non-chemical weed management" • FG 33 on "Pest and diseases of the olive tree", • FG 31 on "Reducing food loss on the farm", • FG 37 on "Contaminated Soil", 	<p>Database on potential yields for different fruit crop species/varieties and critical temperatures on species/variety level; App for assessing frost protection measures considering risk (simulation tool). - related to need for database for potential yield/loss in different conditions;</p> <p>Feed reference database for novel feedstuff (linked with substrate used); Field based artificial intelligence multivariable metabolomics, big data, faeces, saliva, blood, biomarkers;</p> <p>Intelligent intra-row weeding technologies to operate in direct-sown row crops; Individual plant recognition for more precision - large numbers of weed example images are necessary;</p> <p>New systems for pest and disease monitoring: specifically making use of new technologies (IT tools and Internet of Things technologies);</p> <p>ICT applied to agricultural production systems and full agri-food chain monitoring and control;</p> <p>Smart sensors and/or affordable tools for fast determination methods and with improved resolution and accuracy to allow farmers to conduct in-situ field monitoring of the fundamental parameters' contents, mainly the macronutrient concentrations (N, P and K) and organic carbon; Alternative systems for soil scanning and monitoring (besides the laboratory analysis) using state of the art technologies such as remote sensing and drones; Technology for precise use of chemical inputs at the right spot and the right time to minimise the impact on the environment and soil quality;</p>

<ul style="list-style-type: none"> • FG 36 on "Soil salinisation", • FG 35 on "Plant-based medicinal and cosmetic products", • FG 34 on "Bee health", • online 	<p>Specific tools based on models, sensors, weather forecasts, climate and soil data in models; Methodologies (sensors, remote sensing, GIS...) to identify sustainable and non-profit agriculture areas that should go through a land-use change; Development of cheap but reliable sensors for soil salinity measurement; New modelling approaches combining multiple sources of data (remote sensing, terrain attributes, geological maps, land use, meteorological data, irrigation water quality, groundwater level and quality, etc.) for mapping soil salinisation and assessing salinity risk at regional levels;</p> <p>Database on production of MAP (Medicinal and aromatic plant) species; Decision support systems, sensors and digital tools to support decision making for growers or cooperative;</p> <p>European platform better connecting research and practice and contributing to efficiently gathering and exchanging knowledge on beekeeping and bee health;</p> <p>Digitally connected supply chain.</p>
<p>Socio/economic research</p> <p>See</p> <ul style="list-style-type: none"> • FG 32 on "Non-chemical weed management", • FG 31 on "Reducing food loss on the farm", • FG 37 on "Contaminated Soil", • FG 35 on "Plant-based medicinal and cosmetic products" 	<p>Transdisciplinary weed research (TWR) (<i>-->TWR is defined as an integrated process of inquiry and action that addresses complex weed problems in the context of broader efforts to improve economic, environmental and social aspects of ecosystem sustainability</i>); In NCWM (non-chemical weed management), economic costs can mainly be related to the cost of tillage practices, which includes higher labour costs, cost of cover crops and the indirect costs related to less effective weed control and yield loss due to changes in crop rotation. --> It is especially important that farmers' risk perception and subsequent decision making on weed management is integrated in the process;</p> <p>Multi-actor 'value chain approach' to research on food loss and waste on the farm with an integrated mix of researchers, businesses (large and SME) and the citizen (consumer);</p> <p>Social costs of delaying remediation of brownfields or in urban areas; Sustainable farm management - farm-centered approach to incorporate wider biophysical, socio-economic and business components into the farming system;</p> <p>Marketing and consumer studies - country specific marketing and consumer research to identify consumer perceptions of different plant-based products.</p>
